

Gold Road International plc operational update – June 2026

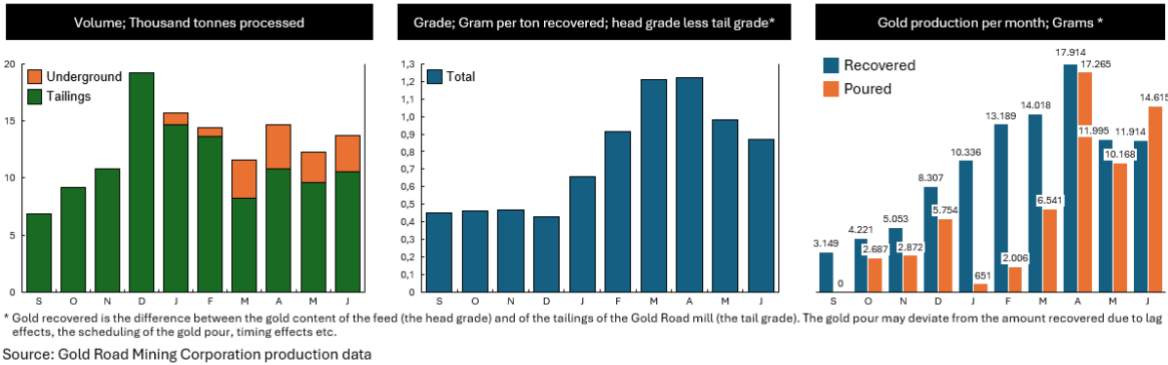

Gold Road International plc (“Gold Road”) reports on its unaudited production figures for June 2026.

Gold Road processed 13,678 tons of feed in total, split between 3,140 tons of feed from the Gold Road Mine (ore) and 10,538 tons of residues from legacy mining operations at the Tom Reed Mine (tailings). The average recovered grade was about 0.87 gram per ton. 11,914 grams of gold were recovered in the mill (383.07 ounces). 14,615 grams of gold were poured as doré (469.90 ounces).

Please see the attached release for further details and production graphics

Tons processed, grade and gold produced

Actuals since mill restart September 2025 to June 2026

The effort through May and June to rehabilitate the main grinding unit of the processing plant, the ball mill, is about to be completed. This will increase grinding capacity, plant throughput and the gold recovery rate. A second filter press line is also about to be installed.

Half a dozen sections of the Gold Road Mine are currently being mined (4201, 500 East, Y-Stope and 970) or are expected to be ready for mining shortly.

Shrink stoping is applied in some sections, whereby the miners extract ore from the bottom up in horizontal slices, blasting the rock overhead. About 80% of the broken ore is left in the stope as a temporary platform to drill the next slice, before being extracted when the whole section (stope) is completed. This is an effective mining method, although it affects the timing and variability of gold production.

Going forward, Gold Road intends to provide an operational update, including unaudited production figures, on a monthly basis.
